

Product Description: SmartTunnel

SmartTunnel uses our standard range of connectivity products combined with tunnelling technology to provide tunnels between sites on our network so that multi-site organisations can run one internal LAN to their remote sites.

All **SmartTunnel** tunnels are **symmetrical**. You can send data at the same speed that you receive it.

There are **no caps on data volume**. You can send and receive as much data as you wish across the tunnels.

SmartTunnel is secure.

SmartTunnel has two types of sites; Main Sites and Satellite Sites.

- **Main Sites** form the central node and are typically sited at the main office. They tunnel to all Remote Sites and can also incorporate a normal Metropolitan Area Network (MAN) connection for access to an internet service provider.
- **Remote Sites** tunnel back to the Main Site.

The diagram on the right illustrates a typical SmartTunnel installation.
